symptoms and electroencephalographic (EEG) characteristics of poorly controlled migraine. Background: The significance of migraine in patients with epilepsy has been considered since ancient times, and it was likely recognized as a risk factor for epilepsy in the 20th century. The association between epilepsy and migraine dates back to the 1970s. Migraine is more

common than epilepsy in the general population, and it has been shown to have a higher prevalence in patients with epilepsy. Both headache and epilepsy are provoked by neurotransmitters that are common to the nociceptive and limbic pain systems; furthermore, there is considerable overlap between the migraine and epilepsy syndromes in terms of their symptomatology and

various aspects of their pathogenesis. Moreover, migraine and epileptic seizures share a genetic background that suggests a pathophysiologic relationship between these 2 conditions. The presence of a migraine history is common in epileptic patients. The relation between migraine and epilepsy is still controversial. Purpose: We aimed to investigate the clinical symptoms and

EEG characteristics of poorly controlled migraine patients. Materials and Methods: Patients were observed at the Neurosurgery Department of Konya Education and Research Hospital with a migraine diagnosis and with poorly controlled migraines. Patients were evaluated via a neurologic examination, semiology, and an EEG. Results: Of the 80 patients enrolled in the study, 43.8%

were male and 56.2% were female. Of these patients, 50% had headaches in their daily lives and 75% had a history of migraine. Compared with seizure-free migraine patients, the seizure-free migraine group had higher rates of migraine-related symptoms and polytherapy. We used the frequencies of A waves and C waves on EEG as the criteria for seizure and seizure-like activity, respectively. Postictal C

waves were observed in 34 of 43 seizure-free patients (79.1%) with a history of migraine. Thirty-nine patients (97.4%) with a history of migraine had polytherapy. Compared with the seizure-free migraine patients, the seizure-free migraine group had a higher rate of aura (61.3% vs 23.2%, P

Pen tools can be used to draw on and

edit images. Some of the most common pen tools are the Pencil tool, which is used to create lines and shapes. The Eraser tool is useful for removing unwanted shapes and lines. The Magic Wand tool allows you to select specific pixels in an image and alter them. For instance, you can select areas of the image and cut them out of the image or fill them in with the same color. Photoshop comes with lots of

effects that can be used on images to give them a special look, such as blurring and lighting effects. You can create a variety of effects. Blur is used to soften and soften edges, or to add a soft focus look to an image. Lighting effects are widely used to create the look of the sun, night or shadows. Lighting effects allow you to simulate the effect of the sun on an object, or to create fake sunlight on a setting or on a

person's face. Shadow effects and blends are also widely used. They allow you to add shadows and highlights to an image to change the way objects look. Shadows and highlights are also useful for adding dimension to objects in an image. Finally, opacity masks are used to selectively hide or display specific areas of an image. If you choose a particular area in an image as the

mask, the contents of the mask will not be visible, allowing you to hide unwanted elements in the image.

Photoshop is a versatile application and offers a wide range of features for editing images, from simple to complex tasks. It is also a very stable tool which has been widely used by photographers and other
